

Fetus Skeleton, 30. week

Price inquiry: +48 605999769, kontakt@openmedis.pl

Product code: MA01019

A detailed skeleton of a human fetus on the base.

Average body length measurements of this skeleton suggest an age of 8.5 to 9 months, but developmental (non-metric) osteological traits are most suggestive from 7 to 7.5 months. The model is a natural cast. Natural cast. Presents numerous ossification centers. Due to the special dyeing technology, the individual elements of the model look very realistic. Model with limited mobility. It has a tripod.

Height: approx. 40cm.

Child Skeleton, 5 year old

Price inquiry: +48 605999769, kontakt@openmedis.pl

Product code: MA00662

Realistic skeleton of a child aged 5 years.

Characteristic:

- The age of the skeleton is confirmed based on the pattern of eruption (eruption) of teeth and the developmental age of individual bones.
- Reproduction of this skeleton includes all primary and secondary ossification centers that exhibit sufficient morphological detail to be isolated, recognized and identified from an anatomical context.
- The overall shape and configuration of individual bones are within the normal 5-year-old limits.
- **Skull:** The overall shape and configuration of the skull and individual bones are normal - limits for a 5-year-old child. The stitch patterns have a normal configuration. Sutures are palpable in the central areas where primary ossification began on the parietal and frontal parts.
- **Teeth:** the model contains all milk teeth.
- No bone pathology.
- The use of a special staining technique makes the bones look very realistic. Arms and lower limbs have limited mobility. It is possible to dismantle the skull.

Additional information:

- Model supplied with a tripod.
- Height: approx. 95 cm
- Weight: approx. 5 kg

Model of Child skeleton 14 to 16 months old

Price inquiry: +48 605999769, kontakt@openmedis.pl

Product code: MA01020

Model of children's skeleton at the age of 14-16 months.

Characteristics:

- It presents the epiphyses of the long bones and the cartilaginous periphery of many bones characteristic of this stage of development.
- The age for this skeleton was determined using a combination of measurements and landmarks.
- The front seam is almost completely closed.
- The atlas (first cervical vertebrae) consists of three parts, and the turntable (second cervical vertebrae) consists of four parts.
- The other cervical, thoracic and lumbar vertebrae consist of two parts (arch and shaft).
- The first 3 sacral vertebrae consist of 5 parts.
- In the foot, heel bones, talus and cubic bones can be recognized by their shape.

Additional information:

- The articulated skeletons is also equipped with a tripod.
- Height: approx 65cm.

Adolescent Skeleton

Price inquiry: +48 605999769, kontakt@openmedis.pl

Product code: MA00661

Pristine examples of adolescent skeletons are rare finds in teaching collections. After much searching, we have discovered an excellent example of an adolescent skeleton. The developing skeleton is very different from adult skeletons -- the numerous ossification centers and growth plates can dramatically change the appearance of individual bones. Learning how to assess and gauge the degree of skeletal maturation is a very basic but critical skill for students of anatomy. Thus, having such a specimen available for laboratory teaching purposes is invaluable. Furthermore, as even the busiest forensic osteologists and anthropologists only rarely encounter the skeletonized remains of adolescents, this specimen may serve as a useful reference tool during the evaluation of individual cases. Stand included.

Size: 154 cm
