

Scarlet Macaw Bandaging Model

Price inquiry: +48 605999769, kontakt@openmedis.pl

Product code: MZ03811

The Scarlet Macaw Bandaging Model is an anatomically correct model for practising bandaging techniques to reduce pain and stabilise fractures.

The macaw has humerus, radius, ulna, metacarpus and phalanx bones with primary, secondary and tertiary feathers attached. Stretchy silicone connects the wing bones to the body to replicate the tendon's instinctive drawback. Positionable wings allow them to be rotated and fold against the body naturally. The model is weighted accordingly to represent a large male scarlet macaw. The head can swivel 360 degrees.
