

Julie simulator for teaching facial anatomy and rejuvenation techniques

Price inquiry: +48 605999769, kontakt@openmedis.pl

Product code: SM03865

Julie was developed to present the anatomy of the face in a clear and explanatory way on how to proceed with the application of botulinum toxin, injectable dermal fillers, thread lifts, laser treatments and so much more. Anatomical landmarks are explicit on the left side of the face, where the nerves, vessels and muscles present opportunities for any customized treatments and demonstrations. A mask containing fat of the left side of a young adult woman's face enables comparison of the shortage of this tissue with another mask, comparing it to the fat tissue of an elderly woman.

The right side allows real palpation of a face coated with fat tissue and skin. Julie was not designed to present results to the treatments. Its use is restricted to the anatomical teaching of the ideal points of application of each product, as well as demonstration of the risks factors. The complete Julie Simulator includes:

- Anatomical unit with acrylic support
- Mask with cushions of facial fat of a young adult
- Mask with cushions of facial fat from a mature woman
- Pointing stick in acrylic
